

Huddle Event Marketplace

Welcome to the **Huddle** platform repository. Huddle is a unified Event and Vendor Marketplace designed to seamlessly connect organizers with attendees. This robust Laravel application handles everything from location-based event discovery and social sharing to secure ticketing and QR-code validation at the door.

System Roles

Huddle operates using a strictly defined role system to ensure a secure and focused experience for every type of user.

1. **Guest:** Can browse the platform, search for events via location/radius, view vendor profiles, and read event details. Must register to buy tickets.
 2. **User (Attendee):** A registered consumer. They can save favorite events, share them on social media, purchase tickets securely, set calendar reminders, and view their personalized QR codes for event entry.
 3. **Vendor (Organizer):** A registered business or event creator. They have a premium public profile with a media gallery, opening hours, and an integrated map. They can create events, manage ticket inventory, view financial orders, and scan attendee QR codes.
 4. **Admin:** The platform owner. They have a global dashboard to oversee all vendors, view total system revenue, track user growth, and manage underlying categorizations.
-

The Core User Journeys

1. The Vendor Journey (Organizers)

A. Onboarding & Profile Setup When a business signs up, they access their Vendor Dashboard to complete their profile. They upload brand imagery, input business parameters (address, phone), set Opening Hours, and select categories. This automatically generates a premium public URL (`/v/their-business`) showcasing their presence.

B. Event Creation & Ticketing Vendors can click "New Event" to draft comprehensive advertisements. They input critical details (dates, times, locations), select target demographics, and upload rich media (photos/videos). For ticketing, they can define custom Ticket Tiers (e.g., "VIP", "Early Bird") and set exact inventory limits.

C. Verification & Validation Vendors track ticket sales and revenue in real-time via their Orders Dashboard. At the physical event, vendors log into the **QR Check-In** panel on their mobile device to scan User QR codes, instantly verifying tickets as `Valid` and updating the system status to `Checked In` to prevent fraud.

2. The User Journey (Attendees)

A. Discovery & Search A user lands on the Home Page and uses the advanced Hero Search. By entering a destination or clicking "**Use My Location**", the system captures their GPS coordinates to execute a radius-based search (e.g., "Events within 25 miles"). The results populate on an interactive map.

B. Interaction & Sharing On an Event Details page, users can explore media galleries, save the event to their profile, or **Set a Notification Reminder**. They can effortlessly share the event using integrated social links (X, WhatsApp, LinkedIn) or add the schedule directly to their Google Calendar / download an iOS/Outlook `.ICS` file.

C. Purchasing & Attending Users select their desired Ticket Tier and proceed through a secure checkout. Upon a successful transaction, a secure hashed Ticket Code is generated. In their "My Tickets" dashboard, the user's ticket dynamically generates a high-contrast QR Code. At the venue, they simply present their screen to the vendor.

3. The Admin Journey

The platform owners access a protected **Admin Dashboard**. Here, they monitor the vitals of the application:

- **High-Level KPIs:** Total Users, Vendors, Live Events, and Total System Revenue (USD).
 - **Quality Control:** A live feed of recently published events ensures the administrative team can quickly spot and resolve spam, ensuring a highly curated ecosystem.
-

Technical Highlights

- **Framework:** Laravel 11 with custom Blade components.
 - **Design System:** Utility-first Tailwind CSS focused on an enterprise-grade, bold, and solid "non-AI" aesthetic with standard SVG libraries (Heroicons) and Ubuntu typography.
 - **Geospatial Processing:** Live distance tracking using Haversine raw SQL queries and coordinate mapping (Leaflet.js + OpenStreetMap).
 - **Ticketing & Security:** On-the-fly QR generation (`qrcode.js`) linked natively to backend validation logic to prevent ticket duplication.
